

Recommendation Guide

Explainable segment-to-recommendation mapping for product, analytics, and RAG responses.

Purpose. This guide maps model segment outputs to explainable, non-personalized product and educational recommendations. Recommendations are behavioral prompts and risk-management support, not a directive to buy, sell, hold, or use a specific financial instrument.

Recommendation workflow

1. Receive the numeric cluster from the segmentation model or the future-segment classifier.
2. Translate the numeric label into the canonical segment name and description.
3. Present the segment-level recommendations with their explanation and the educational disclaimer.
4. Use confidence, recency, and data-quality context to decide how strongly to surface an insight; do not imply certainty from a prediction.
5. Measure engagement and behavior-quality indicators; do not optimize recommendations solely for trading volume.

Recommendation catalog by segment

Segment	Recommended support	Why it fits the observed pattern
Extreme Risk Traders	Reduce leverage usage; improve position sizing; focus on capital preservation; use defined-risk strategies.	Very high leverage, very short holds, lowest win rate, and worst training-population outcomes.
Conservative Income Traders	Continue disciplined risk management; use portfolio analytics; explore advanced income-oriented tools only where appropriate; consider strategy diversification.	Low leverage, long holding horizon, high win rate, and positive outcomes.
High Activity Traders	Track trading costs and slippage; use trade journaling; focus on trade quality over quantity; monitor overtrading behavior.	Highest activity and quick turnover, with moderately negative outcomes.
Structured Strategy Traders	Continue systematic execution; use advanced backtesting tools; explore portfolio optimization; expand a validated strategy portfolio carefully.	Balanced risk, positive outcomes, and controlled leverage.
Aggressive Speculators	Reduce leverage gradually; improve risk-reward selection; adopt stricter stop-loss discipline; focus on consistency over large gains.	High leverage, short holding periods, low win rate, and negative outcomes.

How to phrase an insight

Recommended response pattern

- 1. Identify:** “Your observed behavior aligns with *[canonical segment name]*.”
- 2. Explain:** mention only the material behavioral signals, such as leverage, trade frequency, holding horizon, win rate, or historical performance.
- 3. Guide:** offer the relevant educational tools or risk-management actions from the catalog.
- 4. Bound:** state that the insight is based on model patterns and is not personalized investment advice or a guarantee of outcomes.

Inputs and interpretation rules

Input or condition	Interpretation rule
Full-history cluster	Use the six clustering features and explain that membership reflects combined standardized distance, not a single threshold.
Future-segment prediction	Use first-20-trade features and present the result as a forecast with a confidence score, not as a fact about the trader’s future.
Missing, stale, or poor-quality data	Withhold or soften recommendations; request sufficient validated data before surfacing a segment-based insight.
Behavior shifts materially	Refresh features and prediction. Do not assume a prior segment remains valid indefinitely.
Risk-sensitive behavior	Prioritize education, limits, stop-loss use, and capital preservation over discovery of higher-risk products.

Safety and product guardrails

Do not: promise profitability; imply the model knows an individual’s suitability; encourage higher leverage in response to losses; use a segment as a credit, eligibility, or enforcement decision; or present simulated-data performance as live-market evidence.

- Keep the canonical segment name intact so users can match the explanation to the cluster reference.
- Separate factual observations from suggestions. For example, “average leverage is high” is an observation; “consider lowering exposure” is a general educational suggestion.
- Offer controls and learning resources before promotional product suggestions.
- Maintain an audit trail of model version, feature timestamp, cluster/prediction, confidence, and displayed recommendation set.
- Revalidate the mapping whenever the model or cluster profiles are retrained.

RAG retrieval cues
